

Snowy Plover: Most banded Snowy Plovers observed in Florida were banded as part of research projects in Florida or nearby Gulf Coast states. Snowy plovers are banded with a unique combination of bands that generally includes a Federal metal band and one to three colored bands. Solid and split (bi-colored) bands are used on snowy plover and bands can be on the upper and lower portions of the leg. Banding schemes for snowy plover are challenging to specify by project or region. Thus, we developed an online reporting tool. You can enter your observations [here](#) or you can email raya.pruner@myFWC.com.
